Increased risk

The symbol above gives an indication of the level of risk you carry of developing ischaemic heart disease during your life. This has been calculated on the basis of the family history you have provided.

that will reduce your risk of developing angina or having a heart attack.

You may want to book a rapid access appointment with our online counselor. The online counselor, with your permission, will receive a copy of this report and your family history. They will be able to offer further guidance.

Your family history suggests that you may be at increased risk of inherited or familial hypercholesterolemia (FH). This may also mean that you carry a risk of ischemic heart disease and "heart attack" also known as myocardial infarct (MI).

Current guidelines suggest that you should discuss your family history further with your doctor and ask to have your cholesterol checked.

It would be worth discussing other factors that may also increase your risk of heart attacks or angina.

If you do have FH there is effective treatment available that will reduce your risk of developing angina or having a heart attack.

Family Genetix

FIG 10

Your family history suggests that you may have inherited a gene that causes you to have a high level of cholesterol in your blood.

If you have inherited familial hypercholesterolemia (FH) then you are at greater risk of heart attacks or angina. The diagnosis of FH can only be confirmed by having some blood tests.

Your family history: This diagram shows the structure of your family. The position of your relatives who have been affected by this condition are identified within this structure [Yellow]. Your position in the structure is also shown [black with an arrow to the top left]. Refer to the "Key" above for further help in interpreting the diagram.

- James's eldest son had xanthelasmas
- James's eldest son had a heart attack
- James's eldest son has high cholesterol
- James's mother had xanthelasmas
- James's mother had a heart attack
- James's mother has high cholesterol

FIG 11

Name: David Barker	Relationship: patient's Father	MR#: 87456387	DOB: 12/11/1962										
Cardiovascular events:	Had an MI aged 35.0. Don't know if had a stroke.												
Surgeries:	Don't know if has had angioplasty . Had a heart bypass aged 35.0. Don't know if had a heart transplant.												
Diagnoses:	Don't know if has high blood pressure. Don't know if has diabetes. Don't know if has a thyroid disease. Has a lipid disease. Takes Colestipol/Scoops(3), Lovastatin/mg(46-55) for it.												
Tests:	Don't know if has had a cardid ultrasound test . Has had a heart scan, result was abnormal . Has had a thallium scan, result was abnormal . Don't know if has had a treadmill test .												
Symptoms:													
Risks:	Don't know if exercises regularly Has been overweight Is currently overweight Never smoked
